

Open Core

What is an open source business model and what isn't?
And who cares?

Criticism against Open Core

- It is marketed as open source, but the commercial/main product is proprietary (not OSI license)
- Dilutes the brand/meaning of Open Source (like Shared Source, etc...)
- Small to non-existent dev community
 - Btw, also true for dual licensing
- Unbalanced: you give everything, receive back copyleft
- Worse than proprietary: SW is often licensed per subscription ("rented"), you don't even get to keep the bits, never mind source!
- "The bubble is over", Open Source doesn't need to be "monetized". (Phipps)

What proponents say

- We like open source but we also need to make money.
 - Our investors need ROI
- (Upset) We are very open, here's how open we are...
- Open Source needs lock in to win (over closed source).
- This is similar to Red Hat Enterprise Linux subscriptions.
- This is perfectly legal and there is no punishment for doing it.
- The market will decide which models work and which don't.
Also: The market is "self adjusting".
